

Phase 2T-R result: stopped before A+B calibration

No formal comparison was run

Why the common-region gate failed

Validated Phase 2S index+thumb region: 100% endpoint-hand initial overlap in both groups.

Positive-epsilon mapped region 4358: 0/2,048 strict native index+thumb successes.

Positive-epsilon mapped region 4454: 0/1,520 strict native index+thumb successes.

The protocol forbids freezing a systematically overlapping region or using A+B outcomes to move it.
