

PHYSICS_V1_NEAR_RIGID: not created

Numerical near-rigid assumption only. No material calibration or manipulation-success claim.

Gate A: isolated P0 regression passed exactly for both candidates.

Gate B: 24 impacts completed; no repeated make/break chatter; no energy above initial energy.

Gate C-D: six force-guard stops at 3-4 ms. No simultaneous M/R/L ramp/hold validation.

Impact tradeoff: TC10_IMP99 lowers overlap but raises force peaks and discretization residual.

Neither candidate has enough actual-hand evidence for a production freeze.

No optional sliding/spin test, no receiver run, no parameter retuning after results.
