

P0.5 stop result: physics remains unfrozen

Numerical near-rigid assumption only. No material calibration or manipulation-success claim.

Evidence preserved: 8 regression runs, 24 impact runs, 6 censored hand starts.

The shared native-position-control initialization is not a demonstrated low-force M/R/L regime.

Maximum command increment before termination < 0.000001 actuator-coordinate units.

The stops cannot isolate intrinsic contact instability from startup/control and gravity effects.

Next: PI review of diagnostic initialization/control, then separately authorized contact validation.

Receiver reconstruction, shape, skin, RL and object B remain gated. P0.6 not implemented.

P0.5 is intentionally uncommitted; main was not merged or modified.
